1. 概要 (General description)

随着技术的不断发展,很多经典的电视游戏被移植到了电脑上,或者是通过模拟器的方式在走进电脑游戏玩家的生活中。不过在经过一段时间之后,很多用户都发现,这些原本是通过游戏手柄在操作的游戏,在很多时候使用鼠标和键盘并不能完美的进行控制,而这时候使用无线游戏手柄就是进行游戏的最好解决方案。

2. 特征 (Feature)

采用 2.4GHz 射频无线连接方式,摆脱了连线的困扰。手柄表面质感好,配置简单,按键手感舒适,且反应较为灵敏。工作方式里,由于 2.4G 频段使用带宽越来越紧张,造成器件间波段干扰也越来越严重,由此需要经过新技术来解决此问题,其中最有效的办法就是使用"跳频"通信方式。本工程,使用一个主机六个分机进行跳频通信,完成了一体化设计的工程。下述协议与一对多兼容。主机端开发有 USB 通信口,如果客户需要主机的显示终端,可以再主机端做修改,而手柄在此协议下无须修改。

控制核心,手柄使用: EM78P520+EM198850; 主机使用: EM78M611+EM198850

3. 功能描述 (Function descriptions)

游戏手柄采用了传统的布局方式,最左边是一个八方向的方向键,最右侧是四个按键,呈菱形分布,上面分别印着三角、方块、圆圈和叉子的标记,这和 PS/PS2 手柄的按键完全一样。在中间的则 4 个功能按键和两个迷你型的摇杆,其中 4 个按键分别对应选择(SELECT)、开始(START)以及模式选择键(MODE)和数字/模拟工作方式切换键(MACRO)。另外在手柄的顶部各有两个按钮,分别对应 L1、L2 和 R1、R2。原理图(见附图 1, 附图 2).

RF 游戏手柄

demo 样机

4. 电气特性 (Electrical Characteristics)

- 工作环境温度: -10℃~80℃。
- 工作环境湿度: 30%~95%RH。
- 工作频点: 2402MHz 2482MHz
- 供电电压 采用 3V 电压供电系统
- 耗电电流

搜索状态: 25.0-30.0mA

正常工作时: Imax≤10mA (VDD=3.0V)

待机状态: Imax≤3mA (VDD=3.0V, 摇杆耗电大约2mA)

● 功耗

正常工作时: Wmax≤150MW (VDD=3.0V)

● 通讯距离:

正常通讯时: Lmin≥10M (VDD=3.0V, 办公室环境下)

● 对码过程中,采取先到先分配原则。即对码时需要先关闭所有手柄,此时主机开启强制通讯模式, 依次打开手柄的对码模式,此顺序即为手柄通道的顺序,要更改必须重新对码。

5. Communication Protocol format (通信协议格式)

以主机接收端【sink】为基准,其时序如下,20ms为一个周期(cycle),

第一时段(ComucycleNum = 0)用于时钟同步;

第二时段(ComucycleNum = 1)分配给 发送端【transmitter】1 (GamePadl) 第三时段(ComucycleNum = 2)分配给 发送端【transmitter】2 (GamePad2) 第四时段(ComucycleNum = 3)分配给 发送端【transmitter】3 (GamePad3) 第五时段(ComucycleNum = 4)分配给 发送端【transmitter】4 (GamePad4) 第六时段(ComucycleNum = 5)分配给 发送端【transmitter】5 (GamePad5) 第七时段(ComucycleNum = 6)分配给 发送端【transmitter】6 (GamePad6)

周期号	0		1		2		3		4		5		6
ComuClock	0-7		0-7		8-15		16-23		24-31	4	32-39		40-47
时间	8ms		8ms		8ms		8ms		8ms		8ms		8ms
接收端	CMD_TX	RX		RX		RX		RX		RX		RX	
(RX)	TXD6 USF	3 IN	TXD1 USB	IN	TXD2 USB	IN	TXD3 USB	IN	TXD4 USB	IN	TXD5 USB	IN	TXD6 USB IN
发送端 1 (TX1)	CMD_RX		keyscan										
		TX CM	CMOS										
			GS										
457条第 0					Keyscan								
发送端 2	CMD_RX			TX	CMOS								
(TX2)					GS								
477.735.74F O							Keyscan						
发送端 3 (TX3)	CMD_RX					TX	CMOS						
(1/0)							GS						
发送端 4 (TX4)	CMD_RX	RX		!					Keyscam				
						TX CMOS	CMOS						
									GS				
发送端 5 (TX5)	CMD_RX										Keyscan		
									TX CMOS				
											GS		
发送端 6													Keyscan
及运编 6 (TX6)	CMD_RX											TX	CMOS
(140)													GS

周期号: 根据变量 ComucycleNum 判断 通信时钟: 根据变量 ComuClock 判断

NUM1: 主机发给手柄,用于同步的信息命令包,给手柄调整时间,确保手柄和主机同步

Num2-Num7: 手柄回复给主机的数据封包,传输所需的资料

NUM8: 预留时间给主机和手柄做数据处理。主机 USB 上传资料,手柄处理按键信息等

6. Synchronization information packet format (同步帧数据格式)

Offset	Size	Field	Note			
0	1 BYTE	Length	0X10			
1	1 BYTE	RX_IDH	Rand data, RX ID			
2	1 BYTE	RX_IDL				
3	1 BYTE	CHN_FLAG	Gamepad status, each bit will stand for a Gamepad status			
	Bit [05]	Gamepad X status	6 Gamepad status			
	Bit [67]	reserve	reserve			
4	1 BYTE	CommuStatusFlag	Communication function flag			
	Bit [7]	DescriptorFinishFlag				
	Bit [6]	FccTestModeFlag	FCC test flag			
	Bit [5]	ForceLinkModeFlag				
	Bit [4]	LinkModeFlag				
	Bit [3]	EEpromWRStatusFlag				
	Bit [2]	LoseFrameStatusFlag				
	Bit【1】	NormalStatusFlag				
	Bit [0]	SearchStatusFlag				
5	1 BYTE	DirectionCtrl	0:sink to transmitter 1:transmitter to sink			
			Total Gamepads and Frequency index			
6	1 BYTE	N_CHN	N_CHN= ((TotalGamepads<<4) & $0xF0$) (CH_NO & $0x0F$)			
			TotalGamepads defined by Sink			
7	1 BYTE	TX1_ID	Gamepad1 ID			
8	1 BYTE	TX2_ID	Gamepad2 ID			
9	1 BYTE	TX3_ID	Gamepad3 ID			
10	1 BYTE	TX4_ID	Gamepad4 ID			
11	1 BYTE	TX5_ID	Gamepad5 ID			
12	1 BYTE	TX6_ID	Gamepad6 ID			
	••					
24	1 BYTE	Ver. num	Defined by sink			

NOTE:

- 1) RX_IDH、RX_IDL 两个 BYTE 是由主机在对码时随机生成的数据;
- 2) TX1_ID, TX2_ID, TX3_ID, TX4_ID, TX5_ID, TX6_ID

 $TX1_{ID} = (RX_{IDL \& 0xF0}) \mid 0x01 ; \cdots;$

 $TX6_{ID} = (RX_{IDL} \& 0xF0) \mid 0x06$

- 3) 帧同步头使用 7 BYTE: RX_IDH、RX_IDL、CHN_FLAG、CommunicateStatusFlag、DirectionCtrl、N_CHN
- 4) 初始化与同步过程描述:
 - 主机:读取 EEPROM 中 RX_IDH、RX_IDL、TX1_ID、TX2_ID、TX3_ID、TX4_ID、TX5_ID、TX6_ID 数据,保存到 MCU 中; 当同步对码按键(MACRO)按下时,进入强制通信模式,随机生成 RX_IDH、RX_IDL,运算后可得 TXx_ID, SYNC 使用默认值 0xFF、0xFF,依次开启手柄完成对码;

退出强制通信模式后,把 RX_IDH、RX_IDL、TX1_ID、TX2_ID、TX3_ID、TX4_ID、TX5_ID、TX6_ID 写入 EEPROM; RF 中使用主机 ID【RX_IDH、RX_IDL】重写 DataAddressInRF(reg51-reg57)。

手柄: 读取 EEPROM 中 RX_IDH、RX_IDL、TXx_ID (本机 ID) 数据, 保存到 MCU 中;

当同步对码按键(MACRO)按下时,进入强制通信模式,首次通信上时接收到的 RX_IDH、RX_IDL、TXx_ID 保存在 MCU 中,自动结束强制通信模式,把 RX_IDH、RX_IDL、TXx_ID 写入 EEPROM;

RF 中使用主机 ID【RX_IDH、RX_IDL】重写 DataAddressInRF (reg51-reg57);

7. Communication information packet format (通讯帧数据格式)

Offset	Size	Field	Note			
0	1 BYTE	Length	0x17			
1	1 BYTE	RX_IDH	Danid Jasta DV TD			
2	1 BYTE	RX_IDL	Rand data, RX ID			
3	1 BYTE	CHN_FLAG	Gamepad status, each bit will stand for a gamepad status			
4	1 BYTE	CommuStatusFlag	Communication function flag			
5	1 BYTE	DirectionCtrl	0:sink to transmitter 1:transmitter to sink			
6	1 BYTE	TX_ID	Transmitter ID. Share the position of N_CHN			
7	1 BYTE	Data1	rocker left-x(left-right) RF transmitter data			
8	1 BYTE	Data2	rocker left-y(up-down) RF transmitter data			
9	1 BYTE	Data3	rocker right-x(left-right) RF transmitter data			
10	1 BYTE	Data4	rocker right-y(up-down) RF transmitter data			
11	1 BYTE	Data5	Bit0 bit1 bit2 bit3 bit4 bit5 bit6 bit7 A_1 B_2 C_3 D_4 L1_5 R1_6 L2_7 R2_8			
12	1 BYTE	Data6	bit7 bit6 Bit5 Bit4 Bit3 bit2 bit1 bit0 SELECT_9 START_10 LSW_11 RSW_12 MODE_13 MACRO_14 TEST1 TEST2 MODE: 1:DealWithDigital 0:DealWithAnalog (default:1)			
13	1 BYTE	Data7				
	Bit [74]	Hat Switch	000:00' 001:45' 010:90' 011:135' 100:180' 101:225' 110:270' 111:315'			
Bit [30]		reserve	Constan = 0			
14	1 BYTE	X_Axis_H	reserve			
15	1 BYTE	X_Axis_L	reserve			
16	1 BYTE	Y_Axis_H	reserve			
17	1 BYTE	Y_Axis_L	reserve			
18	1 BYTE	Z_Axis_H	reserve			
19	1 BYTE	Z_Axis_L	reserve			
20	1 BYTE	VersionNum	Software version number			
24	1 BYTE	Ver. Num	Defined by sink			

NOTE:

- 1) 红色字体为同步信息关键字,搜索模式和正常模式必须包含
- 2) 蓝色字体是正常传送的手柄数据,在正常模式下传送,
- 3) 绿色字体暂时未作使用,预留用做用新增功能的数据通道,主机可以不做任何处理
- 4) 数据流传输模式:

主机开机初始化后,在同步头信息中包含 12 byte 的数据,依次是:

RX_IDH、RX_IDL、CHN_FLAG、CommuStatusFlag、DirectionCtrl、N_CHN、TX1_ID、TX2_ID、TX3_ID、TX4_ID、TX5_ID、TX6_ID 手柄接收到同步信息后会回复: RX_IDH、RX_IDL、CHN_FLAG、CommuStatusFlag、DirectionCtrl、TXx_ID(本机 ID)每个通讯周期后 2ms,主机都会根据本次通信周期内的相关信息修改同步头数据,为下一次联机做准备;手柄再次接收到同步信息,检测数据信息如果一切正常,就发送包含同步信息与所需数据每帧共 24 byte 数据:RX_IDH、RX_IDL、CHN_FLAG、CommuStatusFlag、DirectionCtrl、TXx_ID、

Data1、Data2、Data3、Data4、Data5、Data6、【8 byte data】、Ver. Num 主机收到这一帧 24 byte 数据,也会做同步信息检测,如果正常,就把这些数据都收下,不正常做相应处理

8. 伪随机频点列表

EM198810 跳频频点从 2402 MHz - 2482 MHz, 为配合认证测试, 频点范围边沿两端各自内收 2.5 MHz, 即实际工作频点范围取: 2405 MHz - 2479 MHz

RF_CHNO_LISTO:

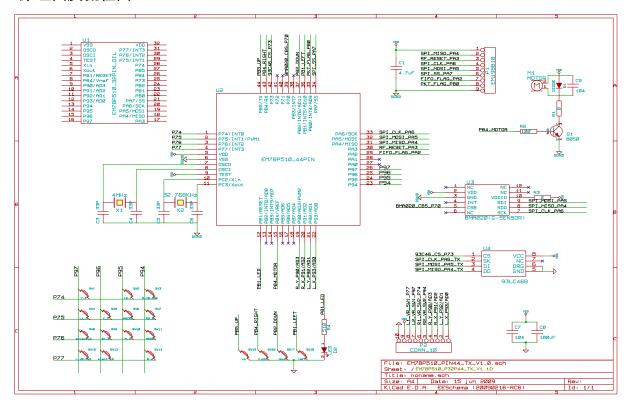

ADD	PC, A		
RETL	@29	;freq:2431	;@0X1D
RETL	@4	;freq:2406	;@0X04
RETL	@67	;freq:2469	;@0X43
RETL	@32	;freq:2434	;@0X20
RETL	@7	;freq:2409	;@0X07
RETL	@65	;freq:2467	;@0X41
RETL	@36	;freq:2438	;@0X24
RETL	@10	;freq:2412	;@0X0A
RETL	@62	;freq:2464	;@0X3E
RETL	@38	;freq:2440	;@0X26
RETL	@8	;freq:2410	;@0X08
RETL	@59	;freq:2461	;@0X3B
RETL	@45	;freq:2447	;@0X2D
RETL	@12	;freq:2414	;@0X0C
RETL	@76	;freq:2478	;@0X4C
RETL	@40	;freq:2442	;@0X28

选用了16个频点进行伪随机,设备频点列表必须依此来跳变

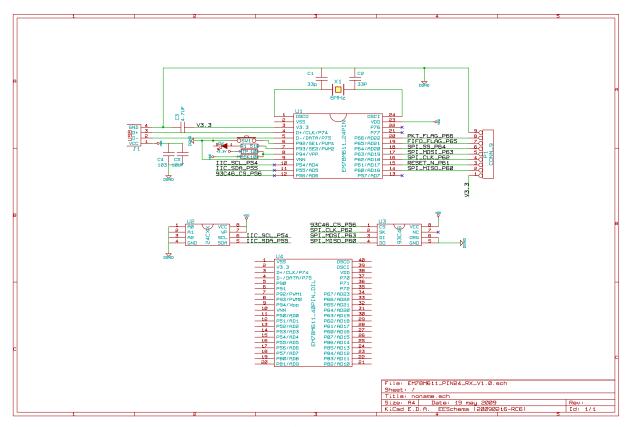

9. 心得:

已经熟练掌握义隆 EM78 系列单片机的使用方法,在此基础上已经对 EM198810 与 EM198850 模块在一对多应用上深有体会。这段时间编制的一套一对多通信协议,可以方便的移植到满足最低资源要求的其它 MCU型号里。1 对多技术已经日趋成熟,依次为基础的通信产品可以由业务提单做推广。
